

Alternative Fuels Production and Production Forecast Biodiesel

No Forecast
No Production

* Production forecasts for Alberta to 2016

Biodiesel is a clean burning alternative fuel, produced from domestic renewable sources. Materials used to produce this fuel include animal fats, tallow, oil from wood pulp waste, and virgin and recycled vegetable oils from crops such as canola, corn, sunflowers, and soybeans.

In 2005, Canada produced 32.5 million litres of biodiesel. This is expected to increase to over 1.7 billion litres annually by 2020.
